

Code Review:

The code snippet(a):

In this code, I need to change the background color of the homepage, as well as the layout of the heading and something else on the page. There are also parts of the subpage that need to be improved in terms of layout. Also, the gap between the header and content needs to be addressed.

The current outcome(b):

So far, I've grasped the fundamentals of HTML design and have used the compiler to generate code. My greatest benefit is that I am familiar with the website's components, such as the header, footer, and so on.

Desired outcome (c):

I'd like to modify the previous code. I can change the image's style padding or margin, border colour, font size, font type, and so on using CSS code.

Present a code snippet using both HTML and CSS that would fix the problem and finally(d):

I want to make the two paragraphs of my article horizontal. I use this flex row code:

```
.container {  
  display: flex;  
  flex-direction: row;  
  align-items: center;  
  justify-content: center;  
}
```

Present the new outcome of the code(e):

Using CSS to change the html code, you can make the page style more attractive, for the image style, the page layout can be changed
